

Sage ERP Onshore Offshore

Case Study: Aquatic Engineering

Acteon is a global sub-sea services organisation, employing more than 750 people worldwide. It comprises eleven specialist companies, each committed to engineering and all focused on the crucial area of offshore oil and gas development between the wells on the seabed and the surface facilities

Taking advantage of Microsoft's worldwide coverage, the software that Aquatic has purchased is available for deployment in over 100 countries, providing local legislation, language, and multi-currency support, allowing for both independent processing and consolidated reporting.

Julie Currie, Finance Manager of Aquatic Engineering says, "International movements of equipment and personnel can be tracked, and associated documentation linked, to provide a comprehensive system for

monitoring and analysing assets. As our company expands internationally, our management system can be extended in a structured and affordable way."

Julie Currie continues, "We opted for Sage ERP Onshore Offshore software because it includes a range of fully integrated routines such as equipment tracking, personnel hire, skills matching and equipment maintenance, along with financial management functionality and because Sage Construction has a reputation for outstanding customer support."

"As our company expands internationally, our management system can be extended in a structured and affordable way."
